Metal Screens Information

Care should be taken when installing powder coated screens, chipping or over screwing can damage powder coat and promote rusting in exposed areas. Rust metal screens must be kept dry (not stacked together) until installation to avoid oxidization. All powder coated screens will be pre-primed (zinc primer) before finish powder coating colours are applied

All metal screens will deposit a small amount of rust staining during weathering process

Natural rust panels more so than corten steel, paving and decking areas below these screen should be protected
